**WARNING****Important safety information enclosed.**

Read all these instructions before placing tool in service or operation and save these instructions. It is the responsibility of the employer to place the information in this manual into the hands of the operator. Failure to observe the following warnings could result in injury. When using electric tools, Basic safety precautions should always be followed to reduce the risk of fire, electric shock and personal injury, including the following:

## Important Safety Rules

**WARNING!** Read all instructions. Failure to follow all instructions listed below may result in electric shock fire and/or serious injury. The term “power tool” in all of the warning listed below refers to your mains-operated (corded) power tool or battery operated (cordless) power tool.

### SAVE THESE INSTRUCTIONS

#### 1) Work area Safety

- a) **Keep work area clean and well lit.** Cluttered and dark areas invite accidents.
- b) **Do not operate power tools in explosive atmosphere, such as in the presence of flammable liquids, gases or dust.** Power tools create sparks which may ignite the dust or fumes.
- c) **Keep children and bystanders away while operating a power tool.** Distractions can cause you to lose control.

#### 2) Electrical Safety

- a) **Power tool plugs must match the outlet. Never modify the plug in any way. Do not use any adapter plugs with earthed (grounded) power tools.** Unmodified plugs and matching outlets will reduce risk of electric shock.
- b) **Avoid body contact with earthed or grounded surfaces such as pipes, radiators, ranges and refrigerators.** There is an increased risk of electric shock if your body is earthed or grounded.
- c) **Don't expose power tools to rain or wet conditions.** Water entering a power tool will increase the risk of electric shock.
- d) **Do not abuse the cord. Never use the cord to carrying, pulling or unplugging the power tool. Keep cord away from heat, oil, sharp edges or moving parts.** Damaged or entangled cords increase the risk of electric shock.
- e) **When operating a power tool outdoors, use an extension cord suitable for outdoor use.** Use of a cord suitable for outdoor use reduces the risk of electric shock.

#### 3) Personal Safety

- a) **Stay alert, watch what you are doing and use common sense when operating a power tool. Do not use power tool while you are tired or under the influence of drugs, alcohol, or medication.** A moment of inattention while operating power tools may result in serious personal injury.
- b) **Use safety equipment. Always wear eye protection.** Safety equipment such as dust mask, non-skid safety shoes, hard hat, or hearing protection used for appropriate conditions will reduce personal injuries. Rubber gloves and non-skid footwear are recommended when working outdoors.
- c) **Avoid accidental starting. Ensure the switch is in the off-position before plugging in.** Carrying power tools with your finger on the switch or plugging in power tools that have the switch on invites accidents.
- d) **Remove any adjusting keys or wrench before turning the power tool on.** A wrench or a key that is left attached to a rotating part of the power tool may result in personal injury.
- e) **Do not overreach. Keep proper footing and balance at all times.** This enables better control of the power tool in unexpected situations.
- f) **Dress properly. Do not wear loose clothing or jewelry. Keep your hair, clothing, and gloves away from moving parts.** Loose clothes, jewelry, or long hair can be caught in moving parts
- g) **Secure work.** Use clamps or a vice to hold the work. It is safer than using your hand and frees both hands to operate the tool.
- h) **If devices are provided for the connection of dust extraction and collection facilities, ensure these are connected and properly used.** Use of these devices can reduce dust-related hazards.

#### 4) Power tool Use and Care

- a) **Do not force the power tool. Use the correct power tool for your application.** The correct power tool will do the job better and safer at the rate for which it was designed.
- b) **Do not use power tool if switch does not turn it on / off.** Any power tool that cannot be controlled with the switch is dangerous and must be repaired.
- c) **Disconnect the plug from the power source before making any adjustments, changing accessories, or storing the power tools.** Such preventive safety measures reduce the risk of starting the power tool accidentally.
- d) **Store idle power tools out of the reach of children and do not allow persons unfamiliar with the power tool or these instructions to operate the power tool.** Power tools are dangerous in the hands of untrained users.  
Do not let visitors touch the tool or extension cord. All visitors should be kept away from work area.
- e) **Maintain power tools. Check for misalignment or binding of moving parts, breakage of parts and any other condition that may affect the power tools operation. If damaged, have the power tool repaired before use.** Many accidents are caused by poorly maintained power tools.  
Inspect extension cords periodically and replace, if damaged.
- f) **Keep cutting tools sharp and clean.** Properly maintained cutting tools with sharp cutting edges are less likely to bind and are easier to control.
- g) **Use the power tools, accessories and tool bits etc., in accordance with these instructions and in the manner intended for the particular type of power tool, taking into account the working conditions and the work to be performed.** Use of the power tool for operations different from those intended could result in a hazardous situation.

#### 5) SERVICE

- a) Have your power tool serviced by a qualified repair person using only identical replacement parts, This will ensure that the safety of the power tool is maintained.

**WARNING !** 

**DO NOT OPERATE THIS TOOL WITHOUT  
PROTECTIVE EARTH CONNECTED**

**Grounding Instructions**

- 1、 This tool should be grounded while in use to protect the operator from electric shock. NOTICE! To ensure the grounding result, the grounding conductor of the power cord must be well connected with the grounding terminal of power facility. This tool is equipped with grounding conductors. The Green (or Green and Yellow) conductor in the Power Cord is the grounding wire. Never connect Green (or Green and Yellow) to a live terminal. The grounding wires in this tool can not only earth the electric leakage safely, but also can eliminate ESD-the electrostatic that tool occurred while in use.
- 2、 The grounding is the most important task for a user. Periodically, depends on the working condition and circumstance, for maintaining a good function, the user has to check the grounding condition every 3~6 months by an electric meter and following simple steps; Set the Ohm meter to level R\*10(Ohm). Touching 2 test rods (“+”&”-”) together and reset the meter to “0”. Using the Red (“+”) rod to touch the Grounding wire on the Plug of controller’s cord, and the Black (“-”) rod to the end of Bit Head. It stands for the grounding is normal if the meter is read as close as to “0”. For getting a normal indication on the meter while in testing, need to press the test rods firmly to the testing objects.
- 3、 The instrument QC of the tool is performed before the tool ex-factory. The grounding continuity test is conducted by input 8A or 25A current (depends on the model) to the end of earth terminal, and subject to the resistance value lower than 0.5(Input 8A current) or 0.1(Input 25A current) Ohm.

## Operations Cautions

- 1) Whenever changing a bit, make certain the Forward / Reverse Switch is in the “OFF” position and tool is unplugged.
- 2) Do not allow chemicals such as acetone, benzene, thinner, trichloroethylene ketone, or other similar chemicals to come in contact with the screwdriver housing as damage will result.
- 3) Do not drop or abuse the screwdriver.
- 4) Do not adjust the torque setting higher than 8 on the torque scale.
- 5) This tool is intended for a duty cycle of 1.0 seconds “ON” and 3.0 seconds “OFF”.
- 6) This screwdriver is not intended to driver wood screws.
- 7) Do not operate the Forward / Reverse Switch while the motor is running.
- 8) Whenever a tool is not being used, move the Forward / Reverse Switch to the “OFF” position and unplug the power cord.
- 9) Don't touch Forward & Reverse Switch during operating for keeping system from wrong judgment.

### CAUTION

- Do not drop or abuse the tool.
- Whenever a tool is not being used, position the Power Switch to the “OFF” position and unplug the power cord.

## Description of Operation

### Attaching / detaching bit and bit type

Push up the holder clamp by fingertip, and it will be unlocked. Thus, the bit can be freely attached and detached (single finger notion type) select such a bit whose shank is equal to the size shown below.

- Insert the power plug into a receptacle and set the changeover switch to “F” position.
- Apply the bit to the screw head and press the lever or push main body (if using a push-to-start model), and then the switch will be turned ON to start the motor running.
- When the screw is tightened and reach the torque that user had set, the tool will stopped automatically.
- To reset the tool, user should release the lever to the original position or release the bit (if using a push-to-start model) from the screw head.
- To return the screw, set the changeover switch to “R” position.

## Servicing

### Maintenance and Inspection:

1. Screwdrivers should be maintained in top running condition and used no more than 8 hours per day.
2. To avoid motor overheating, do not drive more than 10-15 screws per minute.
3. If the screwdriver is used more than 8 hours per day, service should be performed more frequently.
4. Inspect tool cords periodically and if damaged, have them repaired by an authorized service center.  
Inspect extension cords periodically and replace if damaged.
5. Do not remove any labels. Replace any damaged label.

1. The use of other than genuine KILEWS replacement parts may result in decreased tool performance and increased maintenance, and may invalidate all warranties.
2. All repairs and maintenance of this tool and its word must be performed by an authorized service center.
3. KILEWS is not responsible for customer modification of tools for applications on which KILEWS was not consulted.
4. Repairs should be made only by authorized, trained personnel. Consult your nearest KILEWS authorized service center.

## Torque Adjustment Operation

To adjust the torque on these screwdrivers. Proceed as follows:

1. Determine the torque output of the tool by checking a tightened fastener with a torque wrench.
2. Increase or decrease the torque by turning the torque adjusting nut on the nose of the driver. Turning the nut clockwise to a higher number on the torque scale increase torque output while rotating the nut counterclockwise to a lower number decreases the torque output.
3. Check the adjustment with a torque wrench. A number of factors will affect torque output from one job to another. Final torque adjustment should be made at the job through a series of gradual increase. Always start below the desired torque and work upward.
4. Adjust the bit torque by changing the driving in length of the adjust nut at the end.
5. The relationship between torque scale on nut and bit torque is as shown in the torque diagram. The figures of torque scale do not indicate bit torque actual values. However, the clamping torque of screw itself is different from type, size, material of the screw and the material of its mating part. Use it as standard to obtain an appropriate clamping torque.
6. The (Return torque method) in which once-clamped screw is returned with torque wrench or the like is available as one of torque control methods however, note that the measured values by the return torque method generally appear in 10%~30% lower than the actually clamping torque.
7. The torque tester measures the torque of screwdriver. The clamping torque of screw itself is different from the clamped conditions. Understand the correlation between clamping torque values and the torque tester values perform the torque control properly.

### CAUTION

1. Also in reverse rotation, the clutch is shut-off in such manner as in normal rotation, stopping the motor running accordingly, when the screw tightened at a large torque, set it to a higher torque scale.
2. The numbers from zero to eight on the torque scale are reference number only and not an indication of actual torque output.
3. Please refer to Kilews website <http://www.kilews.com> for the detail component list.
